#### **Test procedure**

- 1. The EUT is placed on a turntable, which is 0.8 m above ground plane.
- 2. The turntable shall be rotated for 360 degrees to determine the position of maximum emission level.
- 3. EUT is set 3 m away from the receiving antenna, which is varied from 1m to 4m to find out the highest emissions.
- 4. Maximum procedure was performed on the six highest emissions to ensure EUT compliance.
- 5. And also, each emission was to be maximized by changing the polarization of receiving antenna both horizontal and vertical.
- 6. Repeat above procedures until the measurements for all frequencies are complete.
- 7. Average measurements > 1 GHz using RBW = 1 MHz and VBW = 3 kHz. Peak measurements > 1 GHz using RBW = 1 MHz and VBW = 3 MHz. Both average and peak measurements were made using a peak detector.

#### Note:

- 1. The spectrum is measured from 9 kHz to the 10th harmonic of the fundamental frequency of the transmitter using CISPR quasi peak detector below 1 GHz. Above 1 GHz, average and peak measurements were taken using linearly polarized horn antennas. The worst-case emissions are reported however emissions whose levels were not within 20 dB of the respective limits were not reported.
- 2. When Average result is different from peak result over 20 dB (over-averaging), according to 15.35 (c), as a "duty cycle correction factor", pulse averaging with 20 log(duty cycle) has to be used.
- 3. Emissions below 18 @ were measured at a 3 meter test distance while emissions above 18 @ were measured at a 1 meter test distance with the application of a distance correction factor.
- 4. Average test would be performed if the peak result were greater than the average limit.
- 5. "\*" means restricted band edge.
- 5. Field strength( $dB\mu V/m$ ) = Level( $dB\mu V$ ) + Correction factors(dB/m) + Cable loss(dB) + F<sub>d</sub>(dB)
- 6. Correction factors(dB/m) = Antenna factor(dB/m) + Cable loss(dB) + or Amp. gain(dB)
- 7. Margin(dB) = Limit(dB $\mu$ V/m) Field strength(dB $\mu$ V/m)
- 8.  $F_d = 40 \log(D_m / D_s)$

#### Where:

 $F_d$  = Distance factor in dB

 $D_m$  = Measurement distance in meters

 $D_s$  = Specification distance in meters

#### 3.2. Conducted band edge and out of band emissions

Test setup	_		_	
EUT		Attenuator		Spectrum analyzer

#### Test procedure

DA 00-705

#### **Test setting**

- 1. Span = wide enough to capture the peak level of the in-band emission and all spurious emissions(e.g., harmonics) from the lowest frequency generated in the EUT up through the 10th harmonic.
- 2. RBW = 100 kHz
- $3. \text{ VBW} \geq 300 \text{ kHz}$
- 4. Detector = Peak
- 5. Number of sweep points  $\geq 2 \times \text{Span/RBW}$
- 7. Trace mode = max hold
- 8. Sweep time = auto couple
- 9. The trace was allowed to stabilize

#### Limit

According to 15.247(d), in any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph(b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in section 15.209(a) is not required. In addition, radiated emission which in the restricted band, as define in section 15.205(a), must also comply the radiated emission limits specified in section 15.209(a) (see section 15.205(c))

#### **Test setting**

- 1. Span = 1 Mz (Approximately 2 to 3 times the 20 dB bandwidth, centered on a hopping channel)
- 2. RBW  $\geq 10$  kHz ( $\geq 1\%$  of the span)

Use the marker-delta function to measure 20 dB down on side of the emission. Reset the marker-delta function, and move the marker to the other side of the emission, until it is (as close as possible to) even with the reference marker level.

# **3.5.** Carrier frequency separation

#### **Test procedure**

DA 00-075

#### **Test Setting**

- 1. The EUT must have its hopping function enabled. Use the following spectrum analyzer settings:
- 2. Span = 1 Mb (wide enough to capture the peaks of two adjacent channels)
- 3. RBW = 10 kHz ( $\geq$  1% of the span)
- 4. VBW = 10 kHz ( $\geq$  RBW)
- 5. Sweep = auto
- 6. Detector function = peak
- 7. Trace = max hold

Allow the trace to stabilize. Use the marker-delta function to determine the separation between the peaks of the adjacent channels. The limit is specified in one of the subparagraphs of this Section. Submit this plot.

#### Limit

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater.
